

# Outer Space

Space is big, dark and cold. There is no air or water in space. The sun is the center of our solar system. Nine planets, including the Earth, rotate around the sun. There are many moons, stars and other objects like meteors, asteroids and comets that are part of outer space. Man has sent many things into outer space to explore it, but much of it still remains a mystery.

Identify each item in our Solar System by writing a number on it, as listed below:

- |            |            |                         |
|------------|------------|-------------------------|
| 1. Mercury | 5. Jupiter | 10. Sun                 |
| 2. Venus   | 6. Saturn  | 11. meteor              |
| 3. Earth   | 7. Uranus  | 12. stars and Milky Way |
| 4. Mars    | 8. Neptune |                         |
|            | 9. Pluto   |                         |
