

# Migration

Migration means periodic large-scale movements of populations of animals. Geese are the most well-known migratory birds. In the Spring, geese migrate northward to take advantage of insects, new plants and lots of nesting locations. As winter approaches the birds move south again to escape the cold and find new food. Birds face many hazards as they migrate thousands of miles each year.

Directions: Color the pictures below that represent hazards for birds as they migrate from one location to another.
